SOURCE: Nukleonika, v. 10, no. 5, 1965, 321-330

TOPIC TAGS: EPR spectrum, single crystal, radiation chemistry, crystal chemistry, carboxylic acid, gamma irradiation

ABSTRACT: Changes in EPR spectra of gamma-irradiated crystals of β -succinic acid were studied after prolonged warming and at various temperatures. It was found that (I) $\text{HOOC}-\text{CH}-\text{CH}_2-\text{COOH}$ and (II) $\text{HOOC}-\text{CH}_2-\text{CH}_2-\text{COO}^\bullet$, stable at room temperature, are secondary radicals. A mechanism of formation of secondary radicals from primary ones is proposed. Thanks are due to Mr. Kazimierz for fine technical assistance. Orig. art. has: 9 figures. [NA]

TITLE: EPR spectra of gamma irradiated single crystals of sodium succinate 744:55

SOURCE: Nukleonika, v. 10, no. 6, 1965, 371-374 19

TOPIC TAGS: single crystal, gamma irradiation, organic salt, EPR spectrum,
hyperfine structure, chemical stability

ABSTRACT: The changes in the EPR spectra of gamma-irradiated crystals of sodium succinate with rotation about chosen axes were studied and the hyperfine structure was interpreted. The radical $\text{NaO}_2\text{CCH}_2\text{CH}_2$ was stable at room temperature and the radical $\cdot\text{CO}_2(\text{Na})$ was not stable. This fact confirmed the supposition that the single line observed in beta-succinic acid proceeds from the radical $\text{HO}_2\text{CCH}_2\text{CH}_2\text{COO}\cdot$. The technical assistance of Mr. Kazimierz Mazur is kindly acknowledged. Orig. art. has: 3 figures. [NA]

TITLE: A comparison of abrasive belts with glue-bonded grinding wheels

PERIODICAL: Strojírenská výroba, v. 10, no. 4, 1962, 179-181

TEXT: A brief analysis of grinding technologies with abrasive belts and glue-bonded grinding wheels, respectively, is presented. Considered are cotton-cloth or paper belts with a single, glue- or resin-bonded abrasive coating, and grinding wheels of felt, wood or rubber with several, glue- or resin-bonded abrasive layers on the wheel circumference. A method of calculating the respective economies for a specific operation of belt and wheel grinding is proposed. Better quality and productivity can be obtained with abrasive-coated belts than with glue-bonded wheels especially in continuous processes and in grinding cemented-carbide tools. However, high-quality belts must be used which thus far have not been available in Czechoslovakia. There are 4 figures and 1 table.

Košelev, A. I. Differentiability of solutions of certain problems of potential theory. Mat. Sbornik N.S. 32(74), 653-664 (1953). (Russian)

S. G. Mihlin [Doklady Akad. Nauk SSSR (N.S.) 73, 443-446 (1951); these Rev. 13, 16] showed that if the function $f \in L^2(\Omega)$, where Ω is a plane domain with a sufficiently smooth boundary Γ , then the generalized solution of the Poisson equation $\partial^2 u / \partial x_1^2 + \partial^2 u / \partial x_2^2 = f$, in Ω , subject to the boundary condition $u=0$, on Γ , possesses generalized second derivatives which satisfy

$$\int_{\Omega} \left| \frac{\partial^2 u}{\partial x_i \partial x_k} \right|^2 dx_1 dx_2 \leq C_1 \int_{\Omega} |f|^2 dx_1 dx_2, \quad i=1, 2,$$

where C_1 is a constant independent of f . In the first section of the present paper the author considers similar questions when $f \in L^p(\Omega)$, $p > 1$, treating also the case of domains Ω which can be mapped conformally onto the unit disk by means of sufficiently smooth functions. In the second section the author proves several theorems of a similar nature concerning the dependence of the second partial derivatives of the solution of the Dirichlet problem on the differentiability properties of the prescribed boundary values and on the domain Ω .

Impact resistance of case-hardened gear tooth. V. Kobzev and O. Puchner. *Srojnicky Obozr* 1947, 27-30, 146-53.—Tests were made on steel specimens (20 X 20 X 80 mm.) recessed at both ends to a depth of 7.5 mm. to form 2 strips each 6 mm. wide to represent teeth. The bottoms were rounded off with a radius of 0.9 mm. to correspond with practical conditions at a modulus of 3.5. Three steels (26 specimens) were tested contg. C 0.15, 0.18, and 0.24; Mn 0.34, 0.92, and 1.24; Si 0.19, 0.21, and 0.2; P 0.37, 0.24, and 0.026; S 0.222, 0.024, and 0.022; Cr 0.15, 0.87, and 1.36; and Ni, 0.08, trace, and 0.13%. The specimens were heat-treated in 3 different ways and quenched in oil,

H₂O, or in a salt-bath at 140-200°. Impact tests were made with a standard Izod machine. After the teeth had been broken off, the structures and hardness values of the core and hardened layer were detd. and the surface of the break was examd. The results showed that the case-hardened layer should be as thin as possible, the optimum value being 10% of the tooth thickness, but for very high strength steel it should be even thinner. Removal of the hardened layer on the front of the teeth increases the impact resistance of the tooth by approx. 30%. Tempering in salt-baths does not affect impact resistance. The optimum hardening temp. for C steels is above the Ac3 point of the core; tempering from temps. above the Ac1 point but below the Ac3 point of the core gives much lower impact values. For alloy steels, the data show no appreciable difference between values obtained for single and double hardening at temps. above the Ac3 point. No information was obtained on the influence of free carbides and carbide network structures; in very thick case-hardened layers their influence is negligible.

134. Contribution to the Problem of Temper Brittleness in Steel. (In Czech) Fr. Paboril and V. Kocelav. *Hutnicko Listy*, v. 1, Nov. 1946, p. 97-101; Dec. 1946, p. 130-133; Jan. 1947, p. 153-158.

Results of experiments, which are tabulated and charted, show that in steel having "permanent" temper brittleness, impact resistance, as well as toughness, increases at the same tensile strength with increasing temperature. It was also shown that there is a linear relationship between toughness and impact resistance at low temperatures (-78°C). Results are tabulated and charted.

<p>TEMPER BRITTLENESS. F. Poberil and V. Koselev. (Iron and Steel, 1948, vol. 21, June, pp. 289-294; July, pp. 319-322). This is an English translation of a paper which appeared in Hutnicko Listy, 1946, vol. 1, No. 8, pp. 97-101; No. 6, pp. 130-133; No. 7, pp. 158-159. The authors distinguish between "permanent" and "temporary" temper brittleness; a steel has permanent temper brittleness when the brittleness is not removed by changes in the rate of cooling after tempering. The results of impact tests at $+20^{\circ}\text{C}$ and -78°C on low alloy steels tempered at various temperatures and of explosive tests on a heat treated chromium-nickel-vanadium steel are presented and discussed. In the latter test charges up to 5.25 g of explosive were electrically fired in small piston-like specimens and the type of deformation or fracture designated by number. It was found that the impact resistance in both ordinary and explosive tests of steels prone to permanent temper brittleness, and of equal tensile strength, increases with rising tempering temperature; there was also a linear relation between the resistance to explosion and the</p>

The origin and the cause of coarse-grained intercrystalline fractures in some of the alloyed steels. Vladimir Koblew, *Известия ЛЭТИ* 5, 349-10 (1954).--To det. whether ferrite is an important factor in the occurrence of coarse-grained intercryst. fractures and whether near the limit of occurrence of such fractures there is a change in the A_1 temp., steel contg. 0.45% C and 2% Ni was heated to 1170°, held for 8 hrs. at that temp., cooled to 800° at the rate of 200° per hr., quenched in water from various temps. differing by steps of 100°, cooled below 800° at the rate of 5° per hr. in steps of 20°, fractured, and examd. microscopically. The findings indicate that the tendency to form an intergranular fracture is transitory, occurring in a certain phase of the production, and is not necessarily a defect of the material. If there are no cracks in the part, the tendency to intergranular fracture can be eliminated by heat-treatment. Tensile strength test of a specimen with an intercrystalline fracture was practically equal to that of a specimen which showed a normal, fine-grain structure. E. Gross

AUTHOR: Košelev, Vladimir, Ing. CZECH/34-59-5-6/19

TITLE: The Prospects of a New Method of Evaluating the
Susceptibility to Embrittlement of Materials
(Možnost nového způsobu hodnocení sklonu materiálu
ke zkřehnutí)

PERIODICAL: Hutnické Listy, 1959, Nr 5, pp 409-415 (Czechoslovakia)

ABSTRACT: The ideas put forward by the author arose from the interpretation of the results of impact tests carried out at elevated temperatures (Figs 1-4). The diagrams were obtained as follows: the tested steel was produced, from pure charges, in a high frequency furnace. The basic melt was not alloyed and contained, in addition to Fe, only about 0.25% C. In subsequent melts differing quantities of the studied element were added, for instance 0.23 up to 4.79% Mn. From the ingots 20 mm dia. rods were forged which were quenched from 900°C in oil. From these, impact test specimens were produced which were heated to various temperatures, maintained at those temperatures for one hour and fractured by impact at the same temperature. It was found that all the curves

Card 1/3 have a similar course and can be sub-divided into four

CZECH/34-59-5-6/19

The Prospects of a New Method of Evaluating the Susceptibility
to Embrittlement of Materials

cooling down from 500°C and as a numerical value of this criterion the ratio of the impact strength at room temperature to that at 500°C. At the end a concrete example of classification is quoted for the steels from the six melts produced for the experiments, i.e. with Mn contents of 0.23 to 4.79%, for these the values of this ratio varied between 2.5 (0.23% Mn) and 0.14 (4.79% Mn).

There are 12 figures and 1 table.

TITLE: Brittleness of steel. 3

SOURCE: Hutnik, no. 2, 1965, 79-82

TOPIC TAGS: steel, impact strength, brittleness

ABSTRACT: Importance of impact strength in practical usage of steel is discussed. Sensitivity to notches in tests for notch toughness is discussed, and a method for its evaluation is suggested. Various methods of operating the test apparatus are evaluated. Nomograms allowing classification of materials on the basis of notch toughness, using various shapes and sizes of notches are presented. TITLE: Experimental verification of material flow with the aid of plugs pressed into forged ingots

SOURCE: ^{11.5.78} Hutnicke listy, no. 3, 1965, 169-178

TOPIC TAGS: flow, metal forging, metal welding, crack propagation

ABSTRACT: Flow of forged materials was investigated with the aid of plugs pressed into 8 ton ingots. It was shown that the flow of the material proceeds non-uniformly during the working of an ingot into a forging. The flow of the worked ingot in its section and length need not always agree with the usage of various modelling techniques, models etc. It is shown why forge welding of teeming defects and fissures does not occur in large ingots. The upsetting of large ingots promises a sound forging to be more likely attained than an increase of internal defects. Orig. art. has: 15 figures, 2 formulas, and 2 tables. [JPRS]

Title : On optimum microgeometry and gravimetric wear of a pair of steel-bronze surfaces lapped to a fit

Periodical : Vest. mash. 34/8, 24-25, Aug 1954

Abstract : An account is given of researches conducted to determine the factor of the original condition of surfaces (rough or smooth) that are lapped to a fit, with particular reference to such surfaces as steel against bronze. It is found that rough surfaces become smoother, and smooth surfaces become rougher. Graphs.

TITLE: The Optimum Geometry of a Face Cutter and the Best Cutting Condition in Machining Die Steel (Optimal'naya geometriya tortsovoy frezy i rezhimy rezaniya pri obrabotke shtampovoy stali)

PERIODICAL: Vestnik mashinostroyeniya, 1958, Nr 8, pp 54-56 (USSR)

ABSTRACT: Tests were carried out with die steel, 5 KhGM, of 205 Brinell hardness, milled by a face cutter of 234 mm diameter with carbide-tipped tool bits set at an angle, numbering 2, 3, 4 or 6 around the circumference. The experimental set-up included a flywheel on the cutter spindle to reduce the non-uniformity of rotation. The tool bits had a section of 20 x 25 mm and protruded by 10 - 20 mm from the cutter face. These dimensions and a rigid clamping method ensured the absence of vibration. The blunting criterion was 1 mm wear along the auxiliary edge of the cutter tooth, observed with a binocular eyepiece. The setting angle of the tool bit (slope in elevation) and the angles of the cutting edge were varied in the course of the test. The best angles were found to be: a negative slope of 10°, top rake angles of the main and auxiliary cutting edges, of 5° and 2°10', respectively,

Card1/3

The Optimum Geometry of a Face Cutter and the Best Cutting Condition
in Machining Die Steel

SOV/122-58-8-19/29

planform angles of the main and auxiliary cutting edges of 3° and 45° , respectively, an inclination of the cutting edge of $10^\circ 55'$ and a front clearance angle of 15° . Investigation of the effect of the rate of feed covered the range between 0.029 and 0.016 mm/tooth. In the region of small advances per tooth (below 0.04 mm), a reduction in advance per tooth reduces the tool endurance. The effect of the cutting speed on the endurance was examined at an advance per tooth of 0.04 mm within the range of 88-705 m/min. This effect is more powerful than that of the advance per tooth and therefore large advances are more favourable than high speeds. The complete experimental data are expressed in a power formula. Above an advance per tooth of 0.04 mm, the cutting speed is proportional to the following powers of the variables: 0.41 for the cutter diameter, - 0.48 for the endurance, - 0.29 for the advance per tooth, - 0.05 for the width of cut, - 0.05

Card 2/3

The Optimum Geometry of a Face Cutter and the Best Cutting Condition
in Machining Die Steel.

SOV/122-58-8-19/29

for the number of teeth and - 0.18 for the depth of cut. The proportionality factor is 239. Above an advance of 0.04 mm, the exponent of the advance per tooth changes to 0.15 and the proportionality factor becomes 980. There are 3 figures and 1 table.

AUTHOR: Kosenko, I.N., Candidate of Technical Sciences

TITLE: Effect of face milling conditions on surface deformation of steel

PERIODICAL: Vestnik mashinostroyeniya, no. 6, 1961, 63-65

TEXT: The article describes investigations into surface plastic deformation of steel 5 XFM (5KhGM) under various conditions of milling. Depth of deformation was measured with an x-ray apparatus. Specimens 50 mm³ cut from a forged cube and machined on three sides, were used. To ensure parallelism the faces opposite to the milled ones were ground and lapped. The x-ray camera with tube 8CB-4 (BSV-4) had the anode earthed at 70 kV and the current of 30 mA. A badly defined line on the negative indicated surface deformation. The surface was etched away 10 μ (micron) at a time until a clearly defined line indicated that the deformed layer had been removed. Micro-hardness was measured by apparatus 7MT-3 (PMT-3), designed by M.M. Khrushchov, with a diamond

Effect of face milling...

pyramid of 136° apex angle. Measurements were made on samples $50 \times 50 \times 20$ mm cut from the tested cubes. The applied load was 100 gm for 20 sec. The tested layer was machined at an angle of 2° by grinding and then rubbed with paste $\Gamma O \eta$ (GOI) on a special fixture. Results: A face mill of the following geometry was used: $\omega = -10^\circ$; $\gamma_1 = 5^\circ$; $\alpha = 15^\circ$;

$\varphi = 75^\circ$; $\varphi_0 = 45^\circ$; $f = 1.5$ mm [Abstractor's Note: Symbols not explained].

The depth of cutting $B=3$ mm and width $t = 50$ mm. The speeds of cutting and feeds were:

v m/min	88	110	176	220	280	352	705
-----------	----	-----	-----	-----	-----	-----	-----

s_z mm/tooth	0,052	0,042	0,049	0,04	0,04	0,042	0,037
----------------	-------	-------	-------	------	------	-------	-------

The depth of the deformed layer h and temperature θ are given in graphic form. To obtain the effect of feed on depth of deformation, the same mill (always kept sharp) was used at: $v=220$ m/min, $B=3$ mm, $t=50$ mm. The effect of the removed thickness B on depth h was determined at

Card 2/3

23263

S/122/61/000/006/010/011

D244/D301

Effect of face milling...

$v = 220$ m/min, $t = 50$ mm and $S_z = 0.04$ mm/tooth. The effect of the speed of cutting on hardness was tested with $B=3$ mm and $t=50$ mm at $v =$ m/min 153 352 441; S_z mm/tooth .041 .042 .046. The effect of feed

on hardness is given in Fig. 5 and was measured at the following conditions:

$v=220$ m/min, $B=3$ mm, $t=50$ mm, $S_z=.021$, .029; .04; .12 and

.16 mm/tooth. The results show that the influence of feed on depth of material yield is highest and that of machined thickness is lowest. If deformation to the depth of 0.1 mm is permitted for final machining of steel

5XPM(5KhGM) then the maximum feed is 0.25 mm/tooth. There are 5 figures.

TITLE: Provision for ¹⁴accuracy during calculation and reproduction of a ~~tape~~-recorded program for machining components

SOURCE: Ref. zh. Tekhnologiya mashinostroyeniya, Abs. 12B757

REF SOURCE: Tr. Kuybyshevsk. aviats. in-t, vyp. 20, ch. 1, 1965, 111-120

TOPIC TAGS: machine tool, industrial automation, magnetic recording tape, metal machining

ABSTRACT: The authors point out the general stages in preparation of technological data and recording of programs including the elements of mathematical calculations for the coordinates of support points and equidistant lines from complicated interpolation formulas and recommend a system for the preparatory stages. Individual examples are given together with a system for monitoring the calculation, recording and reproduction of a program for finishing parts on tape-operated machine tools. Two methods for program calculations are described: using fixed keyboard computers with manual control alone and using electronic digital computers. The kinematic diagram is given together with the construction and operation of a control unit for tracing the contour to be machined in a 1:1 scale. 6 illustrations. [Translation of abstract]
